

Question: How to use multiple providers in terraform?

Answer: By using aliases.

```
provider "azurerm" {  
  features {}  
}  
  
provider "azurerm" {  
  features {}  
  alias      = "foo"  
  environment = "german"  
}  
  
resource "azurerm_resource_group" "default" {  
  name      = "something"  
  location = "westeurope"  
}  
  
resource "azurerm_resource_group" "foo" {  
  name      = "someotherthing"  
  location = "westeurope"  
  provider = azurerm.foo  
}
```
